

As a valued SurfacePrep UK customer, we are committed to ensuring your safety whilst operating your blasting equipment.

We would like to remind you that your dust extraction equipment requires a thorough examination and test every 6 or 14 months. Our engineers are LEV P601 competent and carry the calibrated equipment with them.

2002 COSHH Regulation 9 / HSG258 – Controlling airborne contaminants at work

We would also recommend that your blast pot is inspected and pressure tested every 12 months. We are able to complete this on your site. However, if preferred this could also be completed in our workshop in Sheffield.

**Pressure Systems Safety Regulations 2000 SI 128
Pressure Equipment Directive (97/23/EC – PED)**

We would also remind you that if you have an air fed helmet/mask, you are required to air quality test the particulate filter every 3 months.

BS EN12021:2014 Breathing Compressed Air Standards

Over the next few weeks we will have an engineer in your area who would be able to carry out these checks.

If you would like to arrange for an engineer to visit, please call Jacob on 0114 3493582 or email,

Jacob.Capener@HodgeClemco.co.uk

We look forward to hearing from you.
